## Jupiter's moons

Jupiter has 63 moons, but many of them are small. The smallest have a diameter of only a few kilometres. Jupiter's four largest moons are known as the Galilean moons, after their discoverer, Galileo. He was the first to see them with the newly invented telescope in 1610.
Use the table below to make a scale model or drawing of Jupiter and its four largest moons.

|  | DIAMETER | DISTANCE FROM <br> JUPITER | TIME TO <br> ORBIT <br> JUPITER | CHARACTERISTICS |
| :--- | :---: | :---: | :---: | :--- |
| Jupiter | 140000 km | - | - | Jupiter is the largest planet in the <br> Solar System. Like the Sun, Jupiter is <br> mostly made of hydrogen, but unlike <br> the Sun Jupiter is very cold. Jupiter's <br> surface is a mixture of liquid <br> hydrogen and hydrogen gas. |
| Io | 3600 km | 422000 km | 42 hours | lo has over 400 active volcanoes that <br> produce sulfur plumes and lava <br> flows. lo has a rocky surface with a <br> yellow coating of sulfur. |
| Europa | 3200 km | 671000 km | 85 hours | Europa is a rocky moon with a very <br> smooth, icy surface. Scientists <br> believe there is a vast ocean just <br> under Europa's surface. |
| Ganymede | 5300 km | 1000000 km | 172 hours | Ganymede is made of a mixture of <br> rock and ice. It has an underground <br> ocean and a surface covered in <br> impact craters. |
| Callisto | 4800 km | 1880000 km | 247 hours | Callisto is made of a mixture of ice <br> and rock. It has a very ancient <br> surface that is covered in more <br> craters than any other body in the <br> Solar System. |
